  - Gödel's "God Theorem"
  - Could a Finite Machine Match Gödel's Greatness?

A corollary of the First Incompleteness Theorem: We cannot prove (in classical mathematics) that mathematics is consistent.

The Liar Paradox

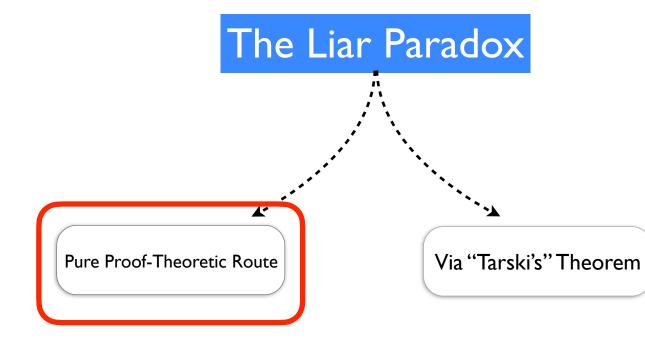

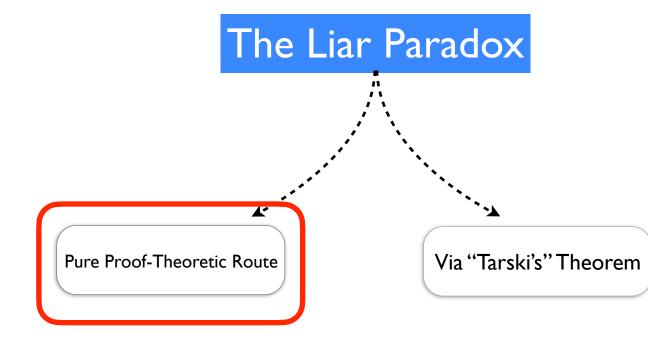

Paul Erdős

"The Book"

Paul Erdős

Ergo, step one: What is LP?

"The Book"

L: This sentence is false.

L: This sentence is false.

Suppose that T(L); then  $\neg T(L)$ .

L: This sentence is false.

Suppose that T(L); then  $\neg T(L)$ . Suppose that  $\neg T(L)$  then T(L).

#### "The (Economical) Liar"

L: This sentence is false.

Suppose that T(L); then  $\neg T(L)$ .

Suppose that  $\neg T(L)$  then T(L).

Hence: T(L) iff (i.e., if & only if)  $\neg T(L)$ .

#### "The (Economical) Liar"

L: This sentence is false.

Suppose that T(L); then  $\neg T(L)$ .

Suppose that  $\neg T(L)$  then T(L).

Hence: T(L) iff (i.e., if & only if)  $\neg T(L)$ .

Contradiction!

 $\bar{P}$ : This sentence is unprovable.

 $\bar{P}$ : This sentence is unprovable.

Suppose that  $\overline{P}$  is true. Then we can immediately deduce that  $\overline{P}$  is provable, because here is a proof:  $\overline{P} \to \overline{P}$  is an easy theorem, and from it and our supposition we deduce  $\overline{P}$  by modus ponens. But since what  $\overline{P}$  says is that it's unprovable, we have deduced that  $\overline{P}$  is false under our initial supposition.

 $\bar{P}$ : This sentence is unprovable.

Suppose that  $\overline{P}$  is true. Then we can immediately deduce that  $\overline{P}$  is provable, because here is a proof:  $\overline{P} \to \overline{P}$  is an easy theorem, and from it and our supposition we deduce  $\overline{P}$  by *modus ponens*. But since what  $\overline{P}$  says is that it's unprovable, we have deduced that  $\overline{P}$  is false under our initial supposition.

Suppose on the other hand that  $\overline{P}$  is false. Then we can immediately deduce that  $\overline{P}$  is unprovable: Suppose for *reductio* that  $\overline{P}$  is provable; then  $\overline{P}$  holds as a result of some proof, but what  $\overline{P}$ says is that it's unprovable; and so we have contradiction. But since what  $\overline{P}$  says is that it's unprovable, and we have just proved that under our supposition, we arrive at the conclusion that  $\overline{P}$  is true.

 $\bar{P}$ : This sentence is unprovable.

## Gödel Numbering, the Easy Way

Just realize that every entry in a dictionary is named by a number n, and by the same basic lexicographic ordering, every computer program, formula, etc. is named by a number m in a lexicographic ordering going from 1, to 2, to ...

So, gimcrack is named by some positive integer k. Hence, I can just refer to this word as "k" Or in the notation I prefer:  $k^{gimcrack}$ .

## Gödel Numbering, the Easy Way

Just realize that every entry in a dictionary is named by a number n, and by the same basic lexicographic ordering, every computer program, formula, etc. is named by a number m in a lexicographic ordering going from 1, to 2, to ...

## Gödel Numbering, the Easy Way

Just realize that every entry in a dictionary is named by a number n, and by the same basic lexicographic ordering, every computer program, formula, etc. is named by a number m in a lexicographic ordering going from 1, to 2, to ...

Or, every syntactically valid computer program in Clojure that you will ever write can be uniquely denoted by some number m in the lexicographic ordering of all syntactically valid such programs. So your program  $\pi$  can just be coded as a numeral  $m^{\pi}$  in a formal language that captures arithmetic (i.e., an *arithmetic language*).

Let  $\Phi$  be a set of arithmetic sentences that is

(i) consistent (i.e. no contradiction  $\phi \land \neg \phi$  can be deduced from  $\Phi$ );

(ii) s.t. an algorithm is available to decide whether or not a given string *u* is a member of Φ; and
(iii) sufficiently expressive to capture all of the operations of a standard computing machine (e.g. a Turing machine, register machine, KU machine, etc.).

Then there is an "undecidable" arithmetic sentence  $\mathscr{G}$  from Gödel that can't be proved from  $\Phi$ , nor can the negation of this sentence (i.e.  $\neg \mathscr{G}$ ) be proved from  $\Phi$ !

## Alas, that's painfully verbose.

Suppose  $\Phi \supset PA$  (=  $\Phi$  contains **PA**) that is

(i) Con Φ;
(ii) Turing-decidable, and
(iii) sufficiently expressive to capture all of the operations of a Turing machine (i.e. Repr Φ).

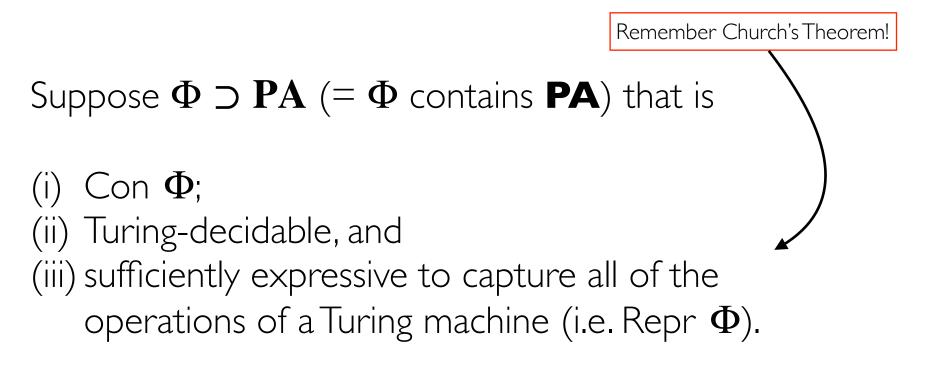

Then there is an arithmetic sentence  $\mathcal{G}$  s.t.  $\Phi \nvDash \mathcal{G}$  and  $\Phi \nvDash \neg \mathcal{G}$ .

Remember Church's Theorem!

Suppose  $\Phi \supset PA$  (=  $\Phi$  contains **PA**) that is

(i) Con Φ;
(ii) Turing-decidable, and
(iii) sufficiently expressive to capture all of the operations of a Turing machine (i.e. Repr Φ).

Then there is an arithmetic sentence  $\mathscr{G}$  s.t.  $\Phi \nvDash \mathscr{G}$  and  $\Phi \nvDash \neg \mathscr{G}$ .

Then there is an arithmetic sentence  $\mathcal{G}$  s.t.  $\Phi \nvDash \mathcal{G}$  and  $\Phi \nvDash \neg \mathcal{G}$ .

# To prove GI, we shall allow ourselves ...

#### The Fixed Point Theorem (FPT)

Assume that  $\Phi$  is a set of arithmetic sentences such that Repr  $\Phi$ . Then for every arithmetic formula  $\psi(x)$  with one free variable x, there is an arithmetic sentence  $\phi$  s.t.

 $\Phi \vdash \phi \leftrightarrow \psi(\hat{n}^{\phi}).$ 

We can intuitively understand  $\phi$  to be saying: ''I have the property ascribed to me by the formula  $\psi$ .''

## "I thought there was no free lunch!"

[W]e "would hope that such a deep theorem would have an insightful proof. No such luck. I am going to write down a sentence ... and verify that it works. What I won't do is give you a satisfactory explanation for why I write down the particular formula that I do. I write down the formula because Gödel wrote down the formula, and Gödel wrote down the formula because, when he played the logic game he was able to see seven or eight moves ahead, whereas you and I are only able to see one or two moves ahead. I don't know anyone who thinks he has a fully satisfying understanding of why the Self-referential Lemma [= FPT]works. It has a rabbit-out-of-a-hat quality for everyone." 

#### The Fixed Point Theorem (FPT)

Assume that  $\Phi$  is a set of arithmetic sentences such that Repr  $\Phi$ . There for every arithmetic formula  $\psi(x)$  with one free variable x, there is an arithmetic sentence  $\phi$  s.t.

 $\Phi \vdash \phi \leftrightarrow \psi(\hat{n}^{\phi}).$ 

We can intuitively understand  $\phi$  to be saying: ''I have the property ascribed to me by the formula  $\psi$ .''

# Ok; so let's do it ...

(Repr\*) = (1) Provable( $n^{\phi}$ ) if and only if  $\Phi \vdash \phi$ .

(Repr\*) = (1) Provable( $n^{\phi}$ ) if and only if  $\Phi \vdash \phi$ .

 $(\mathsf{FPT}^*) = (2) \ \Phi \vdash \mathscr{G} \leftrightarrow \neg \mathscr{P}(\hat{n}^{\mathscr{G}}).$ 

(Repr\*) = (1) Provable( $n^{\phi}$ ) if and only if  $\Phi \vdash \phi$ .

"I'm unprovable!"

 $(\mathsf{FPT}^*) = (2) \ \Phi \vdash \mathscr{G} \leftrightarrow \neg \mathscr{P}(\hat{n}^{\mathscr{G}}).$ 

(Repr\*) = (1) Provable( $n^{\phi}$ ) if and only if  $\Phi \vdash \phi$ .

"I'm unprovable!"

 $(\mathsf{FPT}^*) = (2) \ \Phi \vdash \mathscr{G} \leftrightarrow \neg \mathscr{P}(\hat{n}^{\mathscr{G}}).$ 

Here,  $\phi$  is of course a variable in (1) for any formula; and  $\mathcal{T}$  is a logicization of Provable. Now suppose (for *reductio*)  $\Phi \vdash \mathcal{G}$ . By right-to-left on (1) we deduce Provable( $n^{\mathcal{G}}$ ). We can logicize this as  $\neg \neg \mathcal{P}(\hat{n}^{\mathcal{G}})$ . Then we have  $\Phi \nvDash \mathcal{G}$ , since otherwise a contradiction could be deduced. Contradiction! — and our supposition for *reductio* falls.

(Repr\*) = (1) Provable( $n^{\phi}$ ) if and only if  $\Phi \vdash \phi$ .

"I'm unprovable!"

 $(\mathsf{FPT}^*) = (2) \ \Phi \vdash \mathscr{G} \leftrightarrow \neg \mathscr{P}(\hat{n}^{\mathscr{G}}).$ 

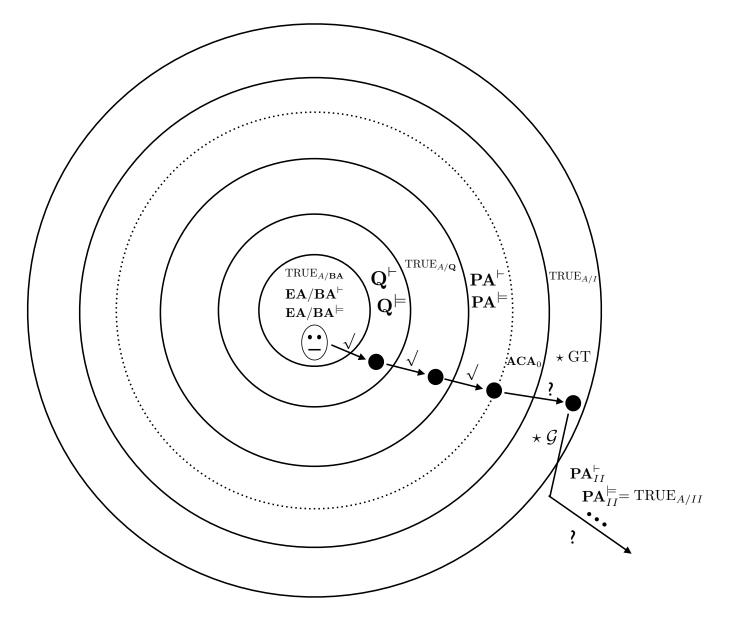

Here,  $\phi$  is of course a variable in (1) for any formula; and  $\mathcal{T}$  is a logicization of Provable. Now suppose (for *reductio*)  $\Phi \vdash \mathcal{G}$ . By right-to-left on (1) we deduce Provable( $n^{\mathcal{G}}$ ). We can logicize this as  $\neg \neg \mathcal{P}(\hat{n}^{\mathcal{G}})$ . Then we have  $\Phi \nvDash \mathcal{G}$ , since otherwise a contradiction could be deduced. Contradiction! — and our supposition for *reductio* falls.

Suppose on the other hand  $\Phi \vdash \neg \mathscr{G}$ . And, suppose for *reductio* that  $\neg$ Provable( $n^{\mathscr{G}}$ ). We can logicize this as  $\neg \mathscr{P}(\hat{n}^{\mathscr{G}})$ , and then we can use (2) to deduce  $\Phi \vdash \mathscr{G}$ . But this entails lnc  $\Phi$  = not-Con  $\Phi$ . Yet our original assumptions (it's (i), specifically) include Con  $\Phi$ , so: contradiction. Therefore (by <u>negation elim</u>) we have Provable( $n^{\mathscr{G}}$ ). But from this, left-to-right on (1), we have  $\Phi \vdash \mathscr{G}$ . But then we have that  $\mathscr{G}$  is both provable and not provable from  $\Phi$ , which is a contradiction with (i) = Con  $\Phi$ ! **QED** 

"Silly abstract nonsense! There aren't any concrete examples of  $\mathcal{G}$ !"
